SQL Server Database

Phase 1 – Core Recruitment System (Weeks 1–2)

The goal is:

"A fully working recruitment platform without AI."

This should include:

- User Login/Register
- CRUD operations
- Database
- JWT Authentication
- Role Management
- Basic dashboards
- Interview scheduling
- Candidate applications

Once this works, your backend and frontend foundation is complete.

Then Phase 2 – Advanced Features

After the MVP is working, add:

- AI Job Recommendations
- Candidate Ranking
- Resume Parsing
- Email Notifications
- Google Calendar
- Cloud Storage
- Analytics

Notice something?

Phase 2 doesn't require changing the whole system. It just plugs into the architecture you built in Phase 1.

That's exactly why good architecture matters.

Member 1 – Authentication & Security

Backend

- Register API
- Login API
- JWT Authentication
- Password Hashing
- Role-Based Access Control (RBAC)

Frontend

- Login Page
- Register Page
- Forgot Password (optional)

Database

- Users
 - Roles
-

Member 2 – Candidate Module

Backend

- Candidate CRUD
- Resume Upload
- Candidate Profile API

Frontend

- Candidate Dashboard
- Profile
- Resume Upload

Database

- Candidates
 - Skills
-

Member 3 – Job & Recruiter Module

Backend

- Job CRUD
- Recruiter CRUD

Frontend

- Recruiter Dashboard
- Job Management

Database

- Recruiters
- Jobs

Member 4 – Application Module

Backend

- Apply Job
- View Applications
- Update Status

Frontend

- Application History
- Apply Screen

Database

- Applications

Member 5 – Interview & Hiring Manager

Backend

- Schedule Interview
- Feedback
- Candidate Evaluation

Frontend

- Hiring Manager Dashboard
- Interview Screen

Database

- Interviews
 - Evaluations
-

Member 6 – Admin & Integration

Backend

- Admin APIs
- Organization Management
- Dashboard APIs

Frontend

- Admin Dashboard
- User Management

Database

- Organizations
- Departments
- Audit Logs

Development order

This is the order I would recommend.

Step 1

Create GitHub Repository

Step 2

Design Database together

Everyone agrees on table names and relationships.

Step 3

Create ASP.NET Solution

RecruitmentSystem

```
|— API
|— Models
|— Services
```

Repository
Data

Step 4

Create Angular Project

```
src
candidate
recruiter
admin
hiring-manager
shared
services
guards
```

Step 5

Authentication

Everything depends on login.

Finish JWT before anything else.

Step 6

Everyone develops their module.

Step 7

Integration

Connect Angular with ASP.NET APIs.

Step 8

Testing

Swagger

Postman

Angular Testing

Step 9

Add AI Features
